- Semantic Trees [Chang-Lee Ch. 4.4]

# Interpretations over the Herbrand Universe

## Interpretations and the Herbrand Universe

Let us consider Interpretations over the **Herbrand universe**.  
Given a set of clauses  $S$  an interpretation must provide:

- assignment for constants to element of the domain
- an assignment for function symbols to element of the domain
- an assignment for predicate symbols to  $\top, \perp$

Where the domain is the Herbrand Universe for  $S$

# H Interpretations

## Definition (H Interpretation)

Let  $S$  be a set of clauses,  $H$  the Herbrand Universe of  $S$  and  $I = \langle D, A \rangle$  an Interpretation of  $S$ .  $I$  is an  $H$ -Interpretation of  $S$  if the following holds:

- $D = H$
- $t^A = t$  for all terms  $t$

## In more detail

- Let  $c$  be a constant symbol  $c^A = c$ .
- Let  $f$  be a  $n$ -ary function symbol  $f^A$  maps  $(h_1, \dots, h_n) \in H^n$  to  $f(h_1, \dots, h_n) \in H$

# H Interpretations: Predicate symbols

## H-Interpretations: Predicate

No restrictions for predicate symbols

Given  $S$ , let  $A = \{A_1, \dots, A_n, \dots\}$  be the Herbrand base (or atom set) of  $S$ , an H-Interpretation can be represented as:

$$I = \{m_1, \dots, m_n, \dots\}$$

where  $m_j = A_j$  or  $m_j = \neg A_j$  for  $j = 1, \dots, n, \dots$

# Example of H-Interpretation

## Example

Consider the set  $S = \{P(x) \vee Q(x), R(f(y))\}$

# Example of H-Interpretation

## Example

Consider the set  $S = \{P(x) \vee Q(x), R(f(y))\}$

## H-Interpretation

- $H = \{a, f(a), f(f(a)), \dots\}$
- $A = \{P(a), Q(a), R(a), P(f(a)), Q(f(a)), R(f(a)), \dots\}$
- Possible  $H$ -Interpretations:
  - $I_1 = \{P(a), Q(a), R(a), P(f(a)), Q(f(a)), R(f(a)), \dots\}$
  - $I_2 = \{\neg P(a), Q(a), R(a), \neg P(f(a)), Q(f(a)), R(f(a)), \dots\}$
  - $I_3 = \{\neg P(a), \neg Q(a), \neg R(a), \neg P(f(a)), \neg Q(f(a)), \neg R(f(a)), \dots\}$

# Example of not H-Interpretation

## Example (not $H$ -Interpretation)

Consider the set  $S = \{P(x) \vee Q(x), R(f(y))\}$ .

$NHI = \langle D, A \rangle$

- $D = \{1, 2\}$
- $f^A(1) = 1, f^A(2) = 2$
- $\{P(1), \neg P(2), Q(1), \neg Q(2), R(1), \neg R(2)\}$

# Mapping among Interpretations

H-  
Interpretation  
and H-  
Satisfiability

Semantic  
Trees

## mapping to H-Interpretations

Given an Interpretation  $I$  we can always find a **corresponding**  $I^*$   
H-Interpretation

# Example of not H-Interpretation II

## Example

Consider the set  $S = \{P(x), Q(y, f(y, a))\}$ .

$I = \langle D, A \rangle$

- $D = \{1, 2\}$
- $a^A = 2$
- $f^A(1, 1) = 1, f^A(1, 2) = 2, f^A(2, 1) = 2, f^A(2, 2) = 1$
- $\{P(1), \neg P(2), \neg Q(1, 1), Q(1, 2), \neg Q(2, 1), Q(2, 2)\}$

# Example of mapping between H-Interpretation

## Example

Given  $S = \{P(x), Q(y, f(y, a))\}$  and  $I$  we can define  $I^*$  as follows:

- 1  $H = \{a, f(a, a), f(a, f(a, a)), f(f(a, a), a), f(f(a, a), f(a, a)), \dots\}$
- 2  $A = \{P(a), Q(a, a), Q(a, f(a, a)), Q(f(a, a), a), P(f(a, a)), Q(f(a, a), f(a, a)), \dots\}$
- 3  $I^* = \{\neg P(a), Q(a, a), P(f(a, a)), \neg Q(a, f(a, a)), \dots\}$ 
  - $P(a) = P(2) = \perp$
  - $Q(a, a) = Q(2, 2) = \top$
  - $P(f(a, a)) = P(1) = \top$
  - $Q(a, f(a, a)) = Q(2, f(2, 2)) = Q(2, 1) = \perp$
  - $\dots$

# Multiplicity of H-Interpretation mapping

## Multiple H-Interpretations

Consider an Interpretation  $I$

- If there is no constant appearing in  $S$  then the added constant  $a$  in the Herbrand Universe can be mapped to any element in  $D$ .
- Therefore there are more than one H-Interpretation  $I^*$  corresponding to  $I$  depending on values given to  $a$

# Example of Multiple H-Interpretations

## Example

Consider the set  $S = \{P(x), Q(y, f(y, z))\}$ .

$I = \langle D, A \rangle$

- $D = \{1, 2\}$
- $f^A(1, 1) = 1, f^A(1, 2) = 2, f^A(2, 1) = 2, f^A(2, 2) = 1$
- $\{P(1), \neg P(2), \neg Q(1, 1), Q(1, 2), \neg Q(2, 1), Q(2, 2)\}$

## Example

Corresponding H-Interpretations

- $I_1^* = \{\neg P(a), Q(a, a), P(f(a, a)), \neg Q(a, f(a, a)), \dots\}$  if  $a = 2$
- $I_2^* = \{P(a), \neg Q(a, a), P(f(a, a)), \neg Q(a, f(a, a)), \dots\}$  if  $a = 1$

# Example of Multiple H-Interpretations II

## Example

Given  $S = \{P(x) \vee Q(x), R(f(y))\}$  and  $NHI = \langle D, A \rangle$

- $D = \{1, 2\}$
- $f^A(1) = 1, f^A(2) = 2$
- $\{P(1), \neg P(2), Q(1), \neg Q(2), R(1), \neg R(2)\}$

we can define  $I_1^*$  as follows:

- 1  $H = \{a, f(a), f(f(a)), \dots\}$
- 2  $A = \{P(a), Q(a), R(a), P(f(a)), Q(f(a)), R(f(a)), \dots\}$
- 3  $a^A = 1$
- 4  $\{P(a) = P(1) = \top, Q(a) = Q(1) = \top, R(a) = R(1) = \top, P(f(a)) = P(1) = \top \dots\}$

# Example of Multiple H-Interpretations II

## Example (cont. from previous example)

we can also define  $I_2^*$  as follows:

- 1  $H = \{a, f(a), f(f(a)), \dots\}$
- 2  $A = \{P(a), Q(a), R(a), P(f(a)), Q(f(a)), R(f(a)), \dots\}$
- 3  $a^A = 2$
- 4  $\{P(a) = P(2) = \perp, Q(a) = Q(1) = \perp, R(a) = R(1) = \perp, P(f(a)) = P(1) = \perp \dots\}$

# Mapping to H-Interpretation

## Definition (Mapping to H-Interpretation)

Given  $I = \langle D, A \rangle$  interpretation over  $D$ , an  $H$ -interpretation  $I^* \langle H, A^* \rangle$  corresponding to  $I$  is an  $H$ -interpretation that satisfies the following condition:

- Let  $h_1, \dots, h_n$  be elements of  $H$  and let  $m : H \rightarrow D$  be a mapping from  $H$  to  $D$ , then
$$P^{A^*}(h_1, \dots, h_n) = P^A(m(h_1), \dots, m(h_n))$$

# Preserving Satisfiability

## Lemma

*If an interpretation  $I$  over a domain  $D$  satisfies a set of clauses  $S$ , then any of the H-Interpretation  $I^*$  corresponding to  $I$  satisfies  $S$ .*

## Sketch of proof.

Suppose  $I \models S$  but  $I^* \not\models S$ .

- Since  $I^* \not\models S$  then  $\exists C^*$  ground that is not satisfied by  $I^*$
- Since  $I^*$  is an H-Interpretation corresponding to  $I$ , for each element in  $I^*$  we can find an element in  $I$  with the same truth value.
- Therefore we have a ground clause  $C$  corresponding to  $C^*$  that is not satisfied by  $I$ , which contradicts the hypothesis

# Preserving Satisfiability Example

## Example

Consider the set of clauses  $S = \{P(x, f(x))\}$ .

Consider the interpretation  $I$ :

- $D = 1, 2$
- $f(1) = 1, f(2) = 2$
- $P(1, 1) = \top, P(1, 2) = \perp, P(2, 1) = \perp, P(2, 2) = \top,$

$I \models S$  because all ground clauses  $\{P(1, 1), P(2, 2)\}$  are satisfied by  $I$ . Assume  $I^*$  is the H-Interpretation corresponding to  $I$  with  $a = 1$ .

- $H_0 = \{a\}, H_1 = \{a, f(a)\}, H_3 = \{a, f(a), f(f(a)), \dots\}$
- $A = \{P(a, a), P(a, f(a)), P(f(a), a), P(f(a), f(a)), \dots\}$
- $P(a, a) = P(1, 1) = \top, P(a, f(a)) = P(1, 1) = \top,$   
 $P(f(a), a) = P(1, 1) = \top, P(f(a), f(a)) = P(1, 1) = \top$

$I^* \models S$  as well.

# H-Satisfiability

## Theorem (H-Satisfiability)

*A set  $S$  of clauses is unsatisfiable iff  $S$  is false under all the H-Interpretations*

## Proof.

### Sketch of proof

- $\Rightarrow$  If unsatisfiable then must be false under all interpretations and thus specifically under all H-Interpretations
- $\Leftarrow$  Assume  $S$  is false under all H-Interpretations but  $S$  is satisfiable. Then there exists  $I \models S$ . Then for the above lemma there exists an H-Interpretation  $I^*$  corresponding to  $I$  such that  $I^* \models S$  which contradicts the hypothesis

# Importance of H-Satisfiability

## H-Interpretations are all we need

- Given the above theorem to prove unsatisfiability of  $S$  we need only to consider  $H$  – *Interpretation*
- We can thus restrict our attention only to the Herbrand universe
- From now onwards we consider only H-Interpretations.

# Observations on Satisfiability I

## Observation I

A ground instance  $C'$  for a clause  $C$  is satisfied by an H-Interpretation  $I$  iff there is at least one literal  $L' \in C'$  such that  $L' \in I$ , which is  $C' \cap I \neq \{\}$ .

## Example

Given  $C \triangleq \neg P(x) \vee Q(f(x))$  and  $C' \triangleq \neg P(a) \vee Q(f(a))$  a ground instance, and

$I = \{P(a), \neg Q(a), P(f(a)), Q(f(a)), \neg Q(f(f(a))) \dots\}$ . Does  $I \models C'$ ?

# Observations on Satisfiability I

## Observation I

A ground instance  $C'$  of a clause  $C$  is satisfied by an H-Interpretation  $I$  iff there is at least one literal  $L' \in C'$  such that  $L' \in I$ , which is  $C' \cap I \neq \{\}$ .

## Example

Given  $C \triangleq \neg P(x) \vee Q(f(x))$  and  $C' \triangleq \neg P(a) \vee Q(f(a))$  a ground instance, and

$I = \{P(a), \neg Q(a), P(f(a)), Q(f(a)), \neg Q(f(f(a))) \dots\}$ . Does  $I \models C'$ ?

Sol.

$I \cap C' = Q(f(a)) \neq \{\}$  therefore  $I \models C'$

# Observation on Satisfiability II

## Observation II

Given a clause  $C$  and an  $H$ -Interpretation  $I$ ,  $I \models C$  iff for every  $C'$  ground instance  $I \models C'$

## Observation III

A clause  $C$  is falsified by an  $H$ -Interpretation  $I$  iff there is at least one  $C'$  ground instance such that  $I \not\models C'$

## Example

Given  $C \triangleq \neg P(x) \vee Q(f(x))$ , and  
 $I = \{P(a), \neg Q(a), P(f(a)), Q(f(a)), \neg Q(f(f(a))) \dots\}$ . Does  
 $I \models C$  ?

# Observation on Satisfiability II

## Observation II

Given a clause  $C$  and an  $H$ -Interpretation  $I$ ,  $I \models C$  iff for every  $C'$  ground instance  $I \models C'$

## Observation III

A clause  $C$  is falsified by an  $H$ -Interpretation  $I$  iff there is at least one  $C'$  ground instance such that  $I \not\models C'$

## Example

Given  $C \triangleq \neg P(x) \vee Q(f(x))$ , and  
 $I = \{P(a), \neg Q(a), P(f(a)), Q(f(a)), \neg Q(f(f(a))) \dots\}$ . Does  
 $I \models C$  ?

Sol.

$C'' = \neg P(f(a)) \vee Q(f(f(a)))$   $I \cap C'' = \{\}$  therefore  $I \not\models C$

# Observations on Satisfiability III

## Observation IV

A set of clause  $S$  is unsatisfiable iff for every  $H$ -Interpretation  $I$  there is at least one  $C'$  ground clause of some  $C \in S$  such that  $I \not\models C'$

## Example

Given  $S \triangleq \{\neg P(x), P(a)\}$  is  $S$  unsatisfiable ?

# Observations on Satisfiability III

## Observation IV

A set of clause  $S$  is unsatisfiable iff for every  $H$ -Interpretation  $I$  there is at least one  $C'$  ground clause of some  $C \in S$  such that  $I \not\models C'$

## Example

Given  $S \triangleq \{\neg P(x), P(a)\}$  is  $S$  unsatisfiable ?

## Sol.

- $H = \{a\}$ ,  $A = \{P(a)\}$
- Only two  $H$ -Interpretations  $I_1 = \{P(a)\}$  and  $I_2 = \{\neg P(a)\}$
- $I_1 \not\models S$  :  $C' = \neg P(a)$  ground instance of  $C = \neg P(x)$  and  $I_1 \not\models C'$
- $I_2 \not\models S$  :  $C'' = P(a)$  ground instance of  $C = P(a)$  and  $I_2 \not\models C''$
- Therefore  $S$  is unsatisfiable.

# Example on Satisfiability

## Example

Consider the clause  $C = \neg P(x) \vee Q(f(x))$ .

$H = \{a, f(a), f(f(a)), \dots\}$  and

$A = \{P(a), Q(a), P(f(a)), Q(f(a)), \dots\}$

- $I_1 = \{\neg P(a), \neg Q(a), \neg P(f(a)), \neg Q(f(a)), \dots\}$
- $I_2 = \{P(a), Q(a), P(f(a)), Q(f(a)), \dots\}$
- $I_3 = \{P(a), \neg Q(a), P(f(a)), \neg Q(f(a)), \dots\}$

Then  $I_1 \models C$ ,  $I_2 \models C$  but  $I_3 \not\models C$ .

## Note

We are assuming a pattern on the Interpretations otherwise we could not decide on satisfiability

# Exercises

## Exercise

- Consider the following clause  $C : P(x) \vee Q(x, f(x))$   
 $I : \{\neg P(a), \neg P(f(a)), \neg P(f(f(a))), \dots$   
 $\neg Q(a, a), Q(a, f(a)), \neg Q(a, f(f(a))), \dots$   
 $\neg Q(f(a), a), Q(f(a), f(a)), \neg Q(f(a), f(f(a))), \dots\}$  Does  $I \models C$  ? [Chang-Lee 8 page 68]
- Consider the following set of clauses  $S : \{P(x), Q(f(y))\}$   
 $I : \{P(a), P(f(a)), P(f(f(a))), \dots$   
 $Q(a), \neg Q(f(a)), Q(f(f(a))), \dots\}$  Does  $I \models S$  ?  
[Chang-Lee 9 page 68]
- Consider the following set of clauses  $S : \{P(x), \neg P(f(y))\}$ 
  - 1 Give  $H_0, H_1, H_2$  and  $H_3$ .
  - 2 Is it possible to find an interpretation that satisfies  $S$  ? If yes provide one. If no explain why [Chang-Lee 10 page 68].

# Semantic Trees

## Basic Concept

- Tree representation of a set of clauses
- Provides information on the satisfiability of the set of clauses

## Example

### Simple Example for Propositional Logic

Figure: Semantic tree for  $S = P \vee Q$

# Semantic Trees: Definition

## Definition (Semantic Tree)

Given a set of Clauses  $S$  let  $A$  be the Herbrand base (or atom set) of  $S$  a **Semantic Tree** for  $S$  is a tree  $T$ , where each link of the tree is annotated with a set of atoms or negation of atoms from  $A$  such that

- 1 property I** For each node  $N$  there are only finitely many immediate links  $\{L_1, \dots, L_m\}$  from  $N$ . Let  $Q_i$  be the conjunction of all literals attached to the link  $L_i$ , then  $Q_1 \vee Q_2 \vee \dots \vee Q_n$  is a **valid** propositional formula.
- 2 property II** For each node  $N$  let  $I(N)$  be the union of all sets attached to the links of the branch connecting  $N$  up to the root and including  $N$ . Then  $I(N)$  does not contain any **complementary pair**.

# Complementary Pair: Definition

## Definition (Complementary Pair)

If  $A$  is an atom then the two literals  $A$  and  $\neg A$  are said to be each other's **complement** and the set  $\{A, \neg A\}$  is said to be a **complementary pair**.

## Note

A Clause that contains a complementary pair is a tautology

## Example

$C = P(x) \vee Q(y, f(y)) \vee \neg R(z) \vee \neg P(x)$  is a tautology as  $\{P(x), \neg P(x)\}$  is a complementary pair

# Example II

## Example

Consider the set of clauses  $S = \{P(x), P(a)\}$ . The atom set for this set of clauses is  $A = P(a)$

Figure: Semantic tree the atom set  $A = P(a)$

# Complete Semantic tree: Definition

## Definition

Complete Semantic Tree Given an atom set  $A = A_1, \dots, A_k, \dots$   
A semantic tree is **complete** iff for every leaf node  $N$ ,  $I(N)$   
contains  $A_i$  or  $\neg A_i$  for  $i = 1, 2, \dots$

## Note

All previous semantic trees were complete

# Example

## Example

Consider a set of clauses  $S = P(f(x))$ , the Herbrand Base for  $S$  is  $A = \{P(a), P(f(a)), \dots\}$  The following Semantic Tree represents  $S$  and is not complete

Figure: Not Complete Semantic tree

# Observations on Semantic Tree

H-  
Interpretation  
and H-  
Satisfiability

Semantic  
Trees

- Given a semantic tree  $T$  representing a set of clause  $S$  for each node  $N$ ,  $I(N)$  is a subset of an interpretation for  $S$
- $I(N)$  is therefore a **partial interpretation** of  $S$
- Given  $S$ , if  $A$  infinite then any complete semantic tree  $T$  for  $S$  is infinite

# Observations on Semantic Trees and Satisfiability

H-  
Interpretation  
and H-  
Satisfiability

Semantic  
Trees

We can use semantic trees to check satisfiability of  $S$

- Given a set of clause  $S$  any complete semantic tree for  $S$  contains all possible interpretations of  $S$ .
- When expanding the semantic tree, we can stop expanding as soon as a partial interpretation falsifies  $S$ .
- If  $I(N)$  falsifies  $S$  we can stop at node  $N$ .

# Definition: Failure Node

## Definition (Failure Node)

Given a set of clauses  $S$  and a semantic tree for  $S$ , a node  $N$  is called a **failure** node iff  $I(N)$  falsifies some ground instances of a clause in  $S$ , but  $I(N')$  does not falsify any ground instance of a clause in  $S$  for every ancestor  $N'$  of  $N$ .

## Example

Consider the clause  $S = \{P \vee Q, Q\}$  build a semantic tree and check which node is a failure node.

# Definition: Closed Tree

## Definition (Closed Semantic Tree)

A semantic tree  $T$  is said to be closed iff every branch of  $T$  terminates at a failure node.

## Definition (Inference Node)

A node  $N$  of a closed semantic tree is called an inference node if all its immediate descendant nodes are failure nodes.

# Closed Semantic Tree: Example I

## Example

Consider the formula  $S = \{P, Q \vee R, \neg P \vee \neg Q, \neg P \vee \neg R\}$   
 $A = \{P, Q, R\}$

Figure: Closed Semantic tree

# Closed Semantic Tree: Example II

## Example
